

AI Free Voice Generation

Monday, 13 July 2026 5:29 pm

🎓 HOW THIS WORKFLOW WORKS

1. Student types text in chat
2. ⚙️ Settings node stores YOUR folder path + voice (edit ONCE here)
3. Code node converts text into a real .txt file
4. That file is saved to your computer
5. Edge TTS (free, offline, no API key) reads the file and creates an MP3
6. The MP3 is read back into n8n so you can preview / send it anywhere

⚠️ PREREQUISITES:

- Must run n8n SELF-HOSTED (Desktop app or Docker). n8n Cloud blocks 'Execute Command' + file system access for security.
- Install Edge TTS on your machine: `pip install edge-tts`
- Create the folder you set in the Settings node BEFORE running (e.g. `mkdir` on your PC)

✅ DONE!

This node outputs the finished MP3 as binary data.

From here, students can chain on:

- 'Respond to Chat' node to preview it
- Send to Telegram/Discord
- Upload to Google Drive
- Feed into a video-editing automation

This is the natural 'Part 2' cliffhanger for your next lesson.

⚙️ STEP 1 — EDIT THESE 2 VALUES

folderPath: where files get saved on YOUR computer

voiceName: which Edge TTS voice to use

Try other voices by running in terminal:

`edge-tts --list-voices`

Popular ones:

- en-US-GuyNeural (male)
- en-US-JennyNeural (female)
- en-GB-RyanNeural (British male)
